

Attorney Docket No. E001.P001U1

**Express Mail No. [EK931641834US]
PATENT**

5

10

15

TO ALL WHOM IT MAY CONCERN:

20 Be it known that I, **Raj [NMI] Mahadevaiah**, having a post office address
and a residence address at 245 Seale Lane, Alpharetta, Georgia 30022, a citizen of
U.S.A., have invented new and useful improvements in a

TELEPHONE INTERCEPTOR

25

for which the following is a specification.

TELEPHONE INTERCEPTOR**CROSS REFERENCE TO A PROVISIONAL APPLICATION**

5 This patent application claims priority on Provisional Application Serial Number 60/151,177, filed on August 27, 1999, the entirety of which is hereby incorporated by reference.

BACKGROUND OF THE INVENTION

10

1. Field of the Invention

15

The present invention relates to telephone communications and, more specifically, to a method and apparatus for intercepting and, if necessary, delaying telephone calls.

2. Description of the Prior Art

20

25

Existing telephones often ring at inopportune moments, such as a just few minutes after a child has begun a nap, a few minutes after a telephone user has stepped into a bath, or when the user simply desires privacy. Several approaches to this problem are typically employed. For example, one may ignore the telephone and allow an answering machine to answer the telephone. However, this approach may be irritating to the user and may wake the freshly fallen asleep child. The user may also turn the telephone ringer "off." However, this approach requires that every telephone in a house be turned off also. The user may take the telephone off of the hook. However, this approach causes incoming callers to believe that the user is actively accepting telephone calls, causing considerable frustration. Also, the user may not be able to place outgoing calls with the off-hook approach.

30

Some telephone sets employ "do not disturb" buttons that inhibit all ringing once activated. However, users often forget to release the do not disturb function

once they desire to start receiving calls again and, thus, miss desired incoming calls. Furthermore, such "do not disturb" buttons usually only apply to a single telephone and not an entire household telephone loop.

5 Therefore, there is a need for a system that allows a user to inhibit ringing of every telephone in a household and, if the user desires, to generate a message indicating that the user wishes not to be called for a selected period of time.

SUMMARY OF THE INVENTION

10

The disadvantages of the prior art are overcome by the present invention which, in one aspect, is an apparatus for intercepting telephone calls on a telephone channel connected to a telephone. A ring detector, that is in communication with the telephone channel, is capable of detecting an incoming telephone call and generates a
15 ring signal upon detection of a incoming telephone call. A user input receives an input from a user indicating that the user desires not to be called. A counter, that is responsive to the user input, is programmed to count a selected amount of time from assertion of the user input. A delay circuit, that is responsive to the counter, the ring signal and the user input, is programmed to allow the telephone to ring if an incoming
20 call has been detected and if more than the selected amount of time has passed since the user input was last asserted. The delay circuit is also programmed to prevent the telephone from ringing if an incoming call has been detected and if less than the selected amount of time has passed since the user input was last asserted.

25 In another aspect, the invention is a method of intercepting telephone calls on a telephone channel connected to a telephone and a user input that indicates that a user desires not to be called. An incoming telephone call is detected on the telephone channel. A ring signal is generated upon detection of a incoming telephone call. It is determined if the user input has been asserted by the user. The telephone is allowed to
30 ring if an incoming call has been detected and if more than a selected amount of time has passed since the user input was last asserted. The telephone is prevented from

ringing if an incoming call has been detected and if less than the selected amount of time has passed since the user input was last asserted.

These and other aspects of the invention will become apparent from the following description of the preferred embodiments taken in conjunction with the following drawings. As would be obvious to one skilled in the art, many variations and modifications of the invention may be effected without departing from the spirit and scope of the novel concepts of the disclosure.

BRIEF DESCRIPTION OF THE FIGURES OF THE DRAWINGS

FIG. 1 is a schematic diagram of one embodiment of the invention.

FIG. 2A is a flow chart showing the timing function.

FIG. 2B is a flow chart showing the inhibiting function.

FIG. 3A is a schematic diagram of one embodiment of an interceptor.

FIG. 3B is a schematic diagram of a timer usable in the embodiment of FIG. 3A.

FIG. 3C is a schematic diagram of a DTMF detector usable in the embodiment of FIG. 3A.

FIG. 3D is a schematic diagram of a power supply driver usable in the embodiment of FIG. 3A.

FIG. 3E is a schematic diagram of voltage regulator usable in the embodiment of FIG. 3A.

FIG. 3F is a schematic diagram of a message generator usable in the embodiment of FIG. 3A.

FIG. 3G is a schematic diagram of a message recording system usable in the embodiment of FIG. 3A.

DETAILED DESCRIPTION OF THE INVENTION

A preferred embodiment of the invention is now described in detail. Referring to the drawings, like numbers indicate like parts throughout the views. As used in the description herein and throughout the claims, the following terms take the meanings explicitly associated herein, unless the context clearly dictates otherwise: the meaning of "a," "an," and "the" includes plural reference, the meaning of "in" includes "in" and "on." Also, as used herein, "global computer network" includes the Internet.

As shown in FIG. 1, the present invention **100**, includes an interceptor **110** that intercepts telephone calls received from a local exchange carrier (LEC) **102** to a household telephone loop **104**. The telephone loop **104** includes one or more telephones **112** connected to a common telephone channel, such as a hard wired telephone line.

The interceptor **110** intercepts incoming telephone calls on the telephone channel and selectively inhibits ringing of the telephone sets **112** connected to the telephone channel for a selected period of time. In one embodiment, a user presses a button, or other user input, that acts like a "snooze bar" on an alarm clock by inhibiting the ringing of the telephone. Once a preselected period from the time the button is depressed has expired, the telephone is allowed to ring normally.

Unlike an answering machine, the invention **100** provides the capability of answering all incoming calls without ringing the telephone sets within a subscriber's local loop for a selected period of time. In one embodiment, each click of the snooze

button will provide a progressively longer period of ring delay. For example, one click will delay ringing for 15 minutes, a second click will delay ringing for 30 minutes, a third click will delay ringing for one hour, etc. Even if the invention is currently active, outgoing calls are allowed any time. Unlike a do not disturb button, the inhibitor 110 is capable of inhibiting ringing for only a selected amount of time, after which the user is able to receive telephone calls normally.

The invention may be embodied as a "do not disturb" device, in which the invention detects the ac ring signal on the telephone line and immediately sets the device to an "off-hook" condition. This action completes the circuit to the local telephone exchange (LEC) and DC current flows to the user's local loop. The LEC removes the ringing signal and the ring-back tone from the circuit. This prevents the ringing signal from reaching any of the telephone sets within the user's local loop. In one embodiment, the invention then plays an audio message to the caller with instructions regarding when to call back. The device then returns the line to the on-hook condition.

The device may also generate a call-in-progress indication to the user. This may be done with an indicator light, a text or graphic indication on a video display (e.g., a television or computer screen), or even by playing soft music. The message could even include a caller identification. The user would then have the option to lift the handset and accept the call. In one embodiment, the invention could automatically activate an answering machine during the delay period, allowing the caller to leave a message.

As shown in FIG. 2A, the inhibitor waits until it senses a user input 202 indicating that the user desires not to be called for a selected amount of time. Upon sensing the user input, the inhibitor starts a timer 204. The inhibitor also continuously waits for incoming calls 210. Upon sensing an incoming call, the device asserts a ring signal 212 and determines if the user input has been asserted 214. If not, then the telephone is allowed to ring 222, otherwise the inhibitor determines if time remains on

the timer **216** (which is typically a count-down timer). If the timer has not timed out then ringing is inhibited **220**, otherwise the telephone is allowed to ring **222**.

The user input could be a button on a telephone handset, or other device. It could also be entered by pressing a preselected set of keys on a telephone key pad. For example, by entering “*47” (or some other sequence of keys) the user could activate the inhibitor. This could be done by circuitry installed in the local telephone, or could be done by software maintained by the LEC. In fact, all of the functions of the invention could be done either locally or at the LEC.

As shown in FIGS. 3A-3G, one embodiment of the invention **310** includes: a unit activator circuit **320** that allows the user to interface with the device, allowing the user to indicate that the user desires not to be called for a selected period; a ring detector and off-hook activator circuit **330** that detects incoming telephone calls and generates a ring signal upon detection of a incoming telephone call, thereby inhibiting ringing of the telephones in a household loop; a voice message playback circuit **340** that generates a voice message to the caller, if the user desires such a message to be generated; and a voice message recording circuit **350** that is used to record voice messages.

The unit activator circuit **320** includes a settable timer circuit, which may be activated by any telephone in the household. The unit activator circuit **320** also includes a circuit **320b** that detects DTMF tones on the telephone channel. The ring detector and activator circuit **330** provides a visual indicator that calls are being intercepted and includes a power supply **330a** that drives the ring inhibiting function. The power supply **330a** allows outgoing calls and allows answering of calls during an interception period. The ring detector and off-hook activator **330** also includes an off-hook activator **330b**.

The voice message playback circuit **340** transmits a user-recorded message indicating that the user is not currently answering telephone calls. The playback circuit

340 could also be programmed to provide an indication to the caller of the amount of time remaining until the caller should try calling again. The voice message recording circuit 350 records messages from callers and acts as an answering machine.

5 As will be clearly understood by those of skill in the art, the invention could be applied to both hard wired telephone lines, wireless telephone lines and virtual telephone lines (*e.g.*, those formed via the global computer network).

10 The above described embodiments are given as illustrative examples only. It will be readily appreciated that many deviations may be made from the specific embodiments disclosed in this specification without departing from the invention. Accordingly, the scope of the invention is to be determined by the claims below rather than being limited to the specifically described embodiments above.
